Making the best use of poker software can help one a long way down the lane minimizing money loss. Normally gambling money is taken from the weekly leisure budget by most players. So, a bit of loss in poker games is considered as money spent on leisure. But that is not the way; money consciousness is one of the basic traits that should be present in any player.

Using poker software effectively can substantially increase the win rate of a player. The software can possibly track out past plays and present statistics of the hands that one was able to play towards a lot of winning; there is also going to be a list of hands that one was not able to play repeatedly over several tables. From the guidance of hand history poker software, it is quite possible to arrive at the best hands that we can count on to invest in order to avoid making huge investments in hands with less scope. The logics and calculations recommended for playing by poker software is nothing new or unexplored. Several authors have flooded the market and online information hubs with ideas about what hands should be played and what should not be played. The percentage winning proposal have been researched and successfully patented for several hands. Making the information even useful is the percentage winning odds of a particular hand against various combinations of board cards. However, remembering the complicated matrix of ideas is really difficult for an average human. Poker software facilitates in picking up the most suitable information in decision making for a particular hand against a particular board. Using the mathematical ideas provided by the poker software we can make a better decision than by remembering logics all by one's own. Indeed the poker software helps one to look in to the real fate of the hand in the table rather than looking in to the hand through hopeless imaginary rosy spectacles. Say, there can be hopes on an AK in a big table in the pre-flop, if the board is going to read something that is less of any hope in the flop with still lot of heads up, the software is going to alert a message of less winning percentage per the new board. With the table being lot of heads up and the software alarming less percentage one can decide to fold without apprehension rather hang on to the AK trap!
