Something that is very important about poker cards is about being able to read the pocket poker cards against the board skillfully. Unless it is your best interest to read the board properly it might be difficult to decipher if we are having the best or worse poker cards at a said point in time.

Let us consider a situation where the poker cards in your pockets is a pair of aces in the preflop; at this point in time with the flop not having come up, there can be no better hand to beat you up. If you have a KK or QQ or JJ you still have a better hand, but with probabilities of someone else holding a better AA or KK or QQ if you have a JJ; and, someone else holding a better AA or KK if you have a QQ; and someone else holding a better AA if you have KK. But in every case, the probability of someone else being better than you varies based on the rank of your pockets. The number of other probable best hands than what you hold versus the number of players in the table matters in your betting decision; however, the starting hand guidelines can serve a safe start.

The starting hand guidelines for poker cards can give an idea about how far one should play and when one should stop playing. The starting hand guidelines give an easy glimpse on whether you can make a pair hand or an unpaired hand or whether you can make a flush and so on. Starting hand guidelines for poker cards do not only tell what to play, it also gives a guideline on how far is a hand worthy to be played.

For example, if you are going to hold an AA in preflop holdem, at that stage it is the unbeatable hand and you can likely count on a probably trip or four of a kind or a full house; however, in the later stages if the board does not read A at all and if there has been a pair of Q in the flop and an 8 or 5 or something else and if someone else is going to be there with a pocket pair of Q then they have probably beat the AA when the flop hits. AA is definitely a good starting hand, but the probabilities for winning with that hand can in many ways be deteriorated by the hands that turn up in the subsequent rounds. Therefore understanding the fate of poker cards under different situations is very crucial.
